

ABSTRACT OF THE DISCLOSURE

A navigation device in which, in accordance with a scrolling instruction given by a user during display on a first screen, a map image is scrolled along a road on which a vehicle position mark is positioned up to a position in a second screen in which a next main intersection is situated at the center of the screen. Regardless of whether a guide route is set, the map image can be scrolled along the road, and the scrolling is stopped at a main intersection that the user wants to confirm.
